## GUI vs. Command-Line Folders and Files

Giving some time and research into both the GUI interface and the Command-Line interface, I believe that it comes down to two things: the personal computer you're running your code on, and also your personal preference to which one you enjoy more.

GUI is special because of how it allows its user to interact with more viewing-based subjects, such as icons, and different types of windows. This (in my opinion) would suit people who learn and operate off of visual cues more, as it is a little bit more stimulating to the eye, compared to Command-Line folders and files. The Command-Line interface also comes down to whether or not you learn better based on memory or visual stimulates. CLI is catered towards people who have that memory-biased learning experience over visual stimulation, because it is based on command inputs rather than certain icons.

Some operating services don't give everyone the choice between the two, though. It's common to always have the CLI, though it is not as common to always rely on GUI with every computer, as some of the providers will not have GUI set up. From my personal experience, I enjoyed GUI a bit more as my brain is stimulated off of visual cues more than commands.
