Learning Styles

I believe that learning styles do absolutely affect how certain people get an education. In the current education system, teachers believe that all kids can and should learn the exact same way. When in reality, there are infinite ways to cater education to each child. The simplest way to try to cater education to each child is by learning the three learning styles: Visual, Auditory, and Tactile.

The visual learning style implements pictures and videos to learn. People like this often like demonstrations as well. While auditory usually learns through certain sounds. Many people who enjoy auditory learning will pick up audio books, or podcasts as well. Lastly, tactile learning will cater towards physical touch and interactive demonstrations, where you actively do tasks to better grasp the subject. This is a classic example of having experience (for example, in a workfield.) I personally resonate with tactile and visual learning styles. I enjoy watching pictures and videos to help me learn, as well as getting my hands dirty and trying out the demonstrations as well.
